Part-time, temporary geophysical field technician

THG currently has short term positions open for geophysical field technicians. The job entails conducting field surveys using electrical resistivity, ground penetrating radar, electromagnetics and shallow seismic methods. Most project work is in support of renewable energy construction projects.

No experience necessary. This is a great opportunity for recent graduates to enhance their field experience. Position is available now and will stay open until filled.

All work involves travel inside of the United States. Crews typically travel for about 10 days per mobilization and work in remote areas. Candidates will be working directly with a geophysicist who will train them in the field. Field work can be physically taxing and often involves working out of an ATV or a truck all day. We pack field lunches and there are no amenities on many of our sites.
